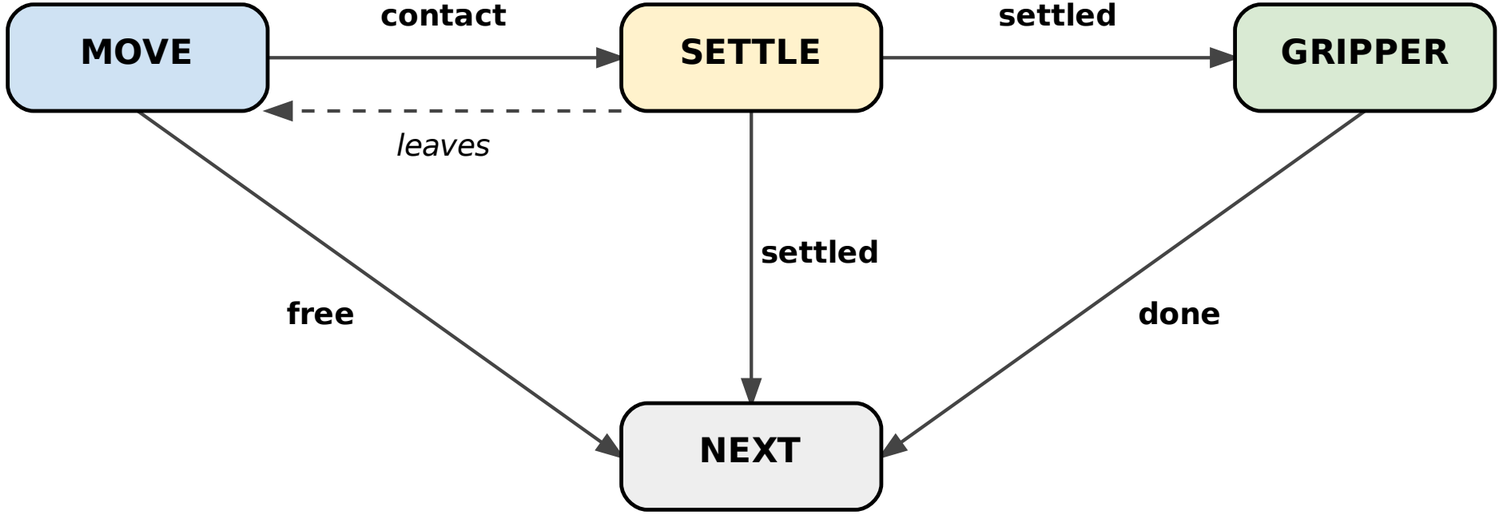
Keyframe execution: when a keyframe counts as reached



States client sequencer; the server MPPI decides how the arm moves	
MOVE	the MPPI tracks the keypose (approach cone on grasps)
SETTLE	wait until the arm stops closing in
GRIPPER	close / open, wait for the fingers
NEXT	the next keyframe becomes active
Transitions	
free	free keyframe: within 2 cm
contact	grasp / release: within 1 cm; approach pose before them: within 2 cm
settled	within 3 mm, or less than 1 mm closer over 10 steps (0.5 s), or 60 steps: the gripper acts on a grasp / release, an approach pose goes straight to NEXT
leaves	the arm leaves the tolerance while settling
done	the fingers have stopped
Note	
Approach poses are known for demo keyframes only: a policy gives one keyframe at a time.
